Parameter: Curascript SP - Liponin 40mg Exceeded Historical Order Averages

Drill into each order received on a line by line basis. Take action on orders at the line level and focus efforts on products with known inventory issues.

KEY BUSINESS BENEFITS:

Streamline the order release process, dramatically improving productivity

Reduce order processing errors and tedious data entry tasks

Increase the efficiency of your order management team

Receive recommended order adjustments based on current inventory levels and channel data

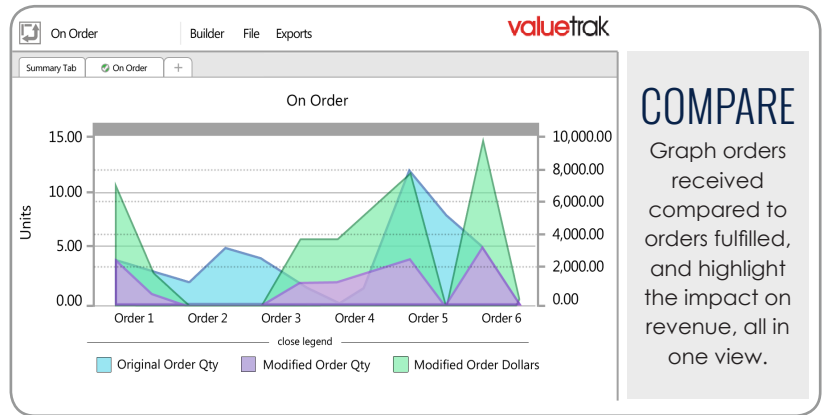

Research your order management history; order decisions are supported with complete, timely and accurate information

Integrate Channel Data with Orders:

ValueTrak seamlessly integrates with your existing ERP system eliminating the need for duplication of data collection and aggregation efforts. Leverage key channel data assets when making order fulfillment decisions.

- ERP integration provides end-to-end visibility for inventory management
- Preserve and add value to existing ERP investments
- ValueTrak provides recommended order fulfillment amounts based on channel data and user-defined system parameters

Automate Order Fulfillment:

Define custom parameters to allow for auto-fulfillment of orders according to threshold requirements. Orders outside of defined parameters are flagged for review and can be split, adjusted, and/or fulfilled on a case by case basis.

- Automate your order process to move product from the warehouse to your patients more effectively
- Review and approve only those orders which fall outside your established business parameters
- Simplify order fulfillment with flexible, customized rules and streamlined workflows
- Set notifications and alerts that warn you of potential inventory problems

Allocate Available Product According to Need:

Intelligent order allocation is critical for products frequently experiencing supply shortages due to events such as highly seasonal demand, production limitations, or revenue control. Define product allocation parameters for a custom date range and your available quantities will automatically adjust as orders are released. Incoming orders are compared side-by-side with channel data and current product stock to efficiently distribute product where it's needed most.

- Line analysis tools provide granular channel detail alongside orders guiding informed fulfillment decisions
- Compare order requests against channel metrics like wholesaler DOH, historical order trends, and current product stock to maximize product availability to patients in need

Comprehensive, Fully Auditable Reporting:

ValueTrak provides access to historical and projected supply/demand for efficient forecasting and auditing. All order actions, including custom fulfillment amounts, are traceable and available for audits on demand.

- Tag order adjustments with custom notes for future reference
- ValueTrak maintains record of original order request and adjusted order fulfillment number
- ValueCentric's SOC 1 compliance ensures your data is accurate, secure, and available when you need it
